Yaya AI: Comprehensive Project Documentation

1. Executive Summary

Yaya AI is a next-generation career automation platform designed to revolutionize the way professionals search for, analyze, and apply to jobs. By integrating directly with the user's workflow—via Gmail synchronization and a Chrome Extension—Yaya AI eliminates the repetitive friction of the job hunt, allowing users to focus on what matters: preparing for interviews and landing the role.

Powered by Google's cutting-edge **Gemini 3 Flash** and **Gemini 3 Pro** models, Yaya AI transforms static career data (resumes) into dynamic, tailored applications that hyper-target specific job requirements.

Automate your Job Hunt with AI

yaya AI is your personal AI-powered job hunting assistant. Scout, draft, and track your way to your dream job faster than ever before.

Start My Journey →

Everything You Need

Streamline your search with our intelligent, state-of-the-art toolset.

Intelligent Inbox Scout

Automatically connects to your email to identify, filter, and scrape job alerts you've received from platforms like LinkedIn and Indeed.

Automated Application Drafting

Instantly generates tailored resumes, cover letters, and personalized email drafts ready for your review.

Real-Time Pipeline Tracking

Visualize your progress with a dynamic dashboard that tracks every application from 'Applied' to 'Offer'.

2. Problem Statement

The modern job search is broken and inefficient:

- **Information Overload:** Job seekers are bombarded with irrelevant alerts from standard aggregators (LinkedIn, Indeed, etc.).
 - **The "Generic Application" Trap:** Tailoring a resume and cover letter for every single application is time-consuming, leading many to send generic materials that get rejected by Applicant Tracking Systems (ATS).
 - **Disjointed Workflow:** Candidates switch between job boards, PDF editors, email clients, and spreadsheets to track applications, losing momentum and data context.
 - **Lack of Insight:** Applicants rarely know *why* they are a good match for a role or how to best position themselves.
-

3. The Solution: Yaya AI

Yaya AI offers a cohesive ecosystem that centralizes the job hunt. It acts as an intelligent layer on top of existing job boards and communication channels.

Core Value Propositions

1. **Context-Aware Automation:** We don't just "autofill" forms. We understand the *context* of the job description and the *nuance* of the user's experience to bridge the gap effectively.
 2. **Workflow Integration:** We meet the user where they are—in their email inbox and on the job boards themselves.
 3. **Premium Experience:** A focus on modern, dark-mode aesthetics and fluid interactions makes the stressful process of applying feels manageable and professional.
-

4. Getting Started: The Setup

To begin your automated career journey, Yaya AI requires two primary data points: your professional history and your job-alert stream.

4.1. Connecting Your Gmail

Yaya AI synchronizes with your Gmail to monitor for incoming job alerts from top-tier platforms. During the onboarding process, you can securely connect your Google account with a single click. This allows the system to parse job descriptions as soon as they hit your inbox.

4.2. Uploading Your Resume

Your resume serves as the "source of truth" for the AI agents. You can upload your master resume in the Profile settings. Yaya AI's Researcher and Writer agents use this document to understand your career trajectory, skill set, and achievements, ensuring all tailored materials remain authentic to your experience.

5. In-Depth Feature Breakdown

5.1. Intelligent Job Synchronization

- **Gmail Integration:** Yaya AI connects to the user's Gmail to parse job alerts from major platforms (LinkedIn, Fuzu, MyJobMag).
- **Smart Parsing:** It doesn't just read the subject line; it extracts the role, company, salary (when available), and applies an initial "Match Score" based on the user's profile.

5.2. Job Alerts Hub (The Application Center)

Distinct from the analytics dashboard, this is the operational headquarters for the job hunt.

- **Centralized Feed:** Aggregates all synced and scouted jobs into a single, clean list.
- **One-Click Actions:** Users can trigger the "Apply with AI" flow directly from this view.
- **Status Tracking:** Moves jobs through stages (New -> Tailoring -> Applied) with visual feedback.

5.3. "The Scout" Chrome Extension

- **Vision-Based API:** Utilizing Gemini 3 Flash's multimodal capabilities, the extension can "see" a job posting on any website. This bypasses complex DOM scraping issues and works universally.
- **One-Click Import:** Users can send a job directly from a board (like Y Combinator Jobs or specialized niche sites) to their Yaya AI Job Alerts hub for later tailoring.

5.4. The AI Creation Suite

This is the heart of the platform.

- **Resume Tailoring:** The AI rewrites the user's summary and experience bullets to align with the keywords and requirements of the target job, without hallucinating skills the user doesn't have.
- **Cover Letter Generation:** Creates a narrative-driven letter that addresses specific pain points mentioned in the JD.
- **Gmail Drafts:** Generates a professional email in the user's actual Gmail Drafts folder, with the tailored PDF materials attached (conceptually), ready for a final review and click of "Send".

5.5. The Sandbox Mode

- **"John Tech" Persona:** A fully functional demo environment where users can test the AI's capabilities using a pre-configured Senior Software Engineer persona.
- **Risk-Free Testing:** Users can generate real documents and see the "Apply with AI" flow without linking their personal data first.

Automate your Job Hunt with AI

6. Target Audience

- **The Active Tech Seeker:** Software engineers, product managers, and designers who need to apply to many roles but demand high quality in each application.
- **The "Passive" Candidate:** Professionals who are happy in their role but want to keep an eye on "perfect match" opportunities without actively scouring job boards.

- **Career Switchers:** Users who need significant help reframing their past experience to match a new industry's terminology—a task Yaya AI excels at.

7. Technical Architecture

Yaya AI utilizes a modern, serverless architecture built on Google Cloud Platform.

7.1. Automated Application Pipeline

Google Cloud | YAYA AI - AUTOMATED JOB APPLICATION PIPELINE

Reference Architecture

A high-fidelity trace of the data flow from the moment a user triggers an application to the final draft creation in Gmail.

7.2. Agentic Orchestration Engine (System Deep Dive)

A deep-dive into the internal backend logic: showing how the ADK Runner orchestrates the MCP toolset and specialized agents (Research, Resume, Cover Letter) using Gemini 3 Pro and Gemini 3 Flash.

7.3. Component Stack

- **Frontend:** Next.js 14 (App Router) with Tailwind CSS for a responsive, performant UI.

- **Backend:** Python (FastAPI/Flask) running on Google Cloud Run. This handles the complex agentic orchestration.
 - **Agentic Layer:** Built using the Model Context Protocol (MCP) and Google's Agent Development Kit (ADK) principles. It manages the state of the "Writer," "Reviewer," and "Job Scout" agents.
 - **Database:** Google Cloud Firestore for real-time data sync between the web app, extension, and backend agents.
 - **AI Models:**
 - **Gemini 3 Flash:** For high-speed tasks like vision parsing in the extension and initial job scoring.
 - **Gemini 3 Pro:** For high-reasoning tasks like rewriting complex resume bullet points and synthesizing cover letters.
-

8. User Interface & Experience

8.1. The Dashboard (Analytics Overview)

8.2. The Job Alerts Hub (Application Center)

Where the work gets done. A dedicated interface for managing individual job cards:

- **Job Feed:** List of all sourced opportunities.
- **Action Controls:** Buttons to "Apply with AI," "Ignore," or "Archive."
- **Status Indicators:** Visual tags showing the current state of each application.

8.3. The Chrome Extension (The Scout)

The overlay that appears on job boards, showing the "Analyzing..." state and the parsed job data before import.

8.4. Applications & Tracking

A dedicated view to manage the lifecycle of active applications, from "Applied" to "Offer".

8.5. The Document Previewer

![[Placeholder: Side-by-side Editor Screenshot]] A *split-screen view*: The *Job Description* on the left, and the *live-generated Resume/Cover Letter* on the right, allowing for easy verification.

8.6. User Profile & Settings

Profile Picture

Update your avatar. This will be visible across the platform.

8.7. The Agentic Chat (Preview)

The conversational interface for instructing your career agents.

9. Future Roadmap

1. **Agentic Chat Applications:** Introducing a conversational interface where users can chat with their specialized agents.
 - *Usage:* "Find the best 3 React roles in my Job Alerts and apply to them."
 - *Async Automation:* The system will orchestrate the Researcher, Resume Writer, and Cover Letter agents to handle the entire pipeline asynchronously and report back when drafts are ready.
2. **Auto-Apply Agents:** Moving beyond "Drafts" to full automated submission for compatible ATS platforms (Greenhouse, Lever).
3. **Interview Prep Agent:** Using the same job context to generate mock interview questions and conduct voice-based practice sessions.
4. **Market Insights:** Aggregating salary data from the synced job alerts to give the user a real-time view of their market value.
